

## Discover our System Rail and its three forms:

### Clever Rail

Sometimes the available heights for the construction of the terrace are limited or even very low, especially in the case of **renovation**.

The Clever Rail adapts perfectly to this type of configuration. Whether it is laid on **floor tiles**, cement, cobblestones or directly on concrete or on any hard surface, the Clever Rail brings **precision** and **security**.

The rubber pads integrated in the system prevent impact sounds and guarantee a free rainwater flow.

### Cover Rail

It is the most **universal** version of the product. The Cover Rail is used for all the currently implemented **joists** for the timber deck construction as well for the **deck on posts**. This system corrects rectitude defects, improves the flatness of the structure and protects exterior sides of the wood.

Careful: in order to receive the Cover Rail, the joist's width should not exceed 61mm; a broader joist is contraindicated for this use because of the water retention that it would cause.

### Perfect Rail

**The best of the best**, in terms of comfort of installation and stability performances, precision and longevity! The Perfect Rail eliminates the risk of structure degradation, even in the most limited configurations with a lack of ventilation (a ground terrace on the lawn).

In addition, the spacers between supports are absolutely amazing: about half as for the wooden structure. Combined with clip JuAn® advantages (from now on dismantable), it is just perfect!

## The advantages of the System Rail

**The System Rail** is a major innovation in the deck construction field. It provides a solution to unsolvable problems, notably concerning the rectitude of structure elements and their sustainability in all these conditions. It allows an **easy and comfortable terrace installation** as well as an **excellent finish quality**.

The System Rail is the last evolution and improvement of the clip JuAn®; it has a lot of advantages:

### 1) **It can be dismantled!**

Despite its grip strength exceeding 100 kg per fixation point, the clip is dismantlable, without any damage!

Two keys delivered with every terrace allow to lift up the plank and to re-position the clip exactly at the same place.

The disassembly of a plank or of a group of planks is particularly important in the following situation:

- Current or exceptional clean-up
- Recovery of a lost item
- Replacement of a damaged plank
- Renewal of the planks

### 2) **It is straight**

The laying of a terrace is often complicated and slowed because of the wood straightness problems.

The Aluminum used for the rail is insensitive to elements and its straightness is impressive. No more twisting and other deformations of structural elements, no more section variations!

### 3) **It is precise!**

The preliminary assembly of clips in the workshop ensures failsafe accuracy and consequently a perfect plank distribution.

### 4) **It is fast!**

It is hard to imagine a system that would be more efficient in time saving than pre'-assembled clip:

- Align the supports
- Level up the structure
- And clip!

## THE SYSTEM RAIL by

### 5) **It is easy!**

Lay your structure as you usually do, then place the clips. All the forms are possible; your imagination is your only limitation.

### 6) **It is modular!**

Available in long length (3m72) or in palette size (1m15) the sections can be connected without problem and without limit!
